

**AMENDMENTS TO THE CLAIMS**

Please amend the claims as indicated below. This listing of claims will replace all prior versions and listings of claims in the application.

1.-36. (Cancelled)

37. (Previously Presented) A method for processing user identifiers stored in a terminal for telecommunications networks, comprising:

modifying the user identifiers by including an identification code of an operator selected by a user of the terminal or at least one of a country prefix and a local prefix;

selectively organizing said user identifiers in one of a plurality of configurations, said plurality of configurations comprising at least a first and a second configuration; and

generating said user identifiers organized in said at least the first configuration and the second configuration by means of an if/then mechanism, in which the if function identifies at least one value selected from the group of:

a number of digits included in the user identifiers to be organized, and

the digits present in specified positions of said user identifiers to be organized;

wherein said first configuration comprises the user identifiers organized with the insertion of the identification code of the operator selected by the user of the terminal,

wherein said second configuration comprises the user identifiers organized with the inclusion of at least one of the country prefix and the local prefix, and

wherein the modified user identifiers are stored in the terminal.

38. (Previously Presented) The method as claimed in claim 37, wherein said identification code of the operator is an identifier of a long distance operator.

39. (Cancelled)

40. (Previously Presented) The method as claimed in claim 37, comprising generating said user identifiers organized in said at least the first configuration and the second configuration by means of an if/then mechanism in which the then function implements at least one function selected from the group of:

adding said identification code to the user identifiers to be organized in said first configuration, and

associating with the user identifiers to be organized at least one of the country prefix and the local prefix in said second configuration.

41. (Previously Presented) The method as claimed in claim 37, comprising receiving from the user of the terminal information relating to a location of said terminal and the operation of switching said user identifiers between said first configuration and said second configuration following the receipt of the information.

42. (Previously Presented) The method as claimed in claim 37, comprising detecting a location of said terminal and of switching said user identifiers between said first configuration and said second configuration according to the detected location of the terminal.

43. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally consisting of 7 or 8 digits

by adding a digit 0, the local prefix identified by the user and said identification code to the user identifiers organized in said first configuration, and

by adding a character "+", the country prefix and the local prefix provided by the user to the user identifiers organized in said second configuration.

44. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally consisting of 10 or 11 digits

by adding said identification code to the user identifiers organized in said first configuration, and

by removing a “0” in a first position and adding the country prefix to the user identifiers organized in said second configuration.

45. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally consisting of 12 or 13 digits

by replacing a second and a third digit with said identification code in the user identifiers organized in said first configuration, and

by removing a “0” in a first position and the second and third digits, replacing the second and third digits with an international prefix in the user identifiers organized in said second configuration.

46. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally comprising the code “00”

by replacing a third and a fourth digit with said identification code in the user identifiers organized in said first configuration, and

by removing the first four digits and adding a symbol “+” to the user identifiers organized in said second configuration.

47. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally comprising said country prefix

by removing said country prefix and including said identification code in the user identifiers organized in said first configuration, and

by leaving the user identifiers unchanged in the case of said second configuration.

48. (Previously Presented) The method as claimed in claim 37, comprising organizing said user identifiers originally comprising a symbol “+”

by removing the symbol “+” and entering said identification code preceded by two “0” symbols in the user identifiers organized in said first configuration, and

by leaving the user identifiers unchanged in the case of said second configuration.

49. (Previously Presented) The method as claimed in claim 37, comprising: when indicators corresponding to special services are present, leaving the user identifiers unchanged without carrying out the configuration in said at least the first and at least the second configuration.

50. (Previously Presented) The method as claimed in claim 37, wherein said plurality of configurations comprises a network call configuration with an associated identification code consisting of a code for activation of a call by the network designed to enable said terminal to be called back by the corresponding network.

51. (Previously Presented) The method as claimed in claim 50, wherein said call activation code is associated with a prepaid roaming service.

52. (Previously Presented) The method as claimed in claim 37, wherein said plurality of configurations comprises a debiting configuration with an associated identification code consisting of a billing code for configuring stored numbers of said terminal for making calls to be debited to a called user.

53. (Previously Presented) The method as claimed in claim 37, wherein said plurality of configurations comprises an authorization configuration with an associated identification code consisting of a code which authorizes calls from two or more lines associated with the terminal or with a corresponding card of the SIM type.

54. (Previously Presented) A terminal for telecommunications networks, comprising at least a storage area for storing user identifiers and acting as an electronic address book, and processing capacity for processing the user identifiers stored in said storage area, said processing

capacity being configured for modifying the user identifiers by including an identification code of an operator selected by a user of the terminal or at least one of a country prefix and a local prefix and organizing said user identifiers selectively in one of a plurality of configurations, said plurality of configurations comprising at least a first and a second configuration,

wherein said first configuration comprises the user identifiers organized with the insertion of the identification code of the operator selected by the user of the terminal,

wherein said second configuration comprises the user identifiers organized with the inclusion of at least one of the country prefix and the local prefix, and

wherein the modified user identifiers are stored in the terminal, and

wherein said processing capacity is configured for generating said user identifiers organized in one of said at least the first and at least the second configuration by means of an if/then mechanism, in which the if function identifies at least one value selected from the group of:

a number of digits included in the user identifiers to be organized, and

the digits present in specified positions of said user identifiers to be organized.

55. (Previously Presented) The terminal as claimed in claim 54, wherein said identification code of the operator is an identifier of a long distance operator.

56. (Cancelled)

57. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for generating said user identifiers organized in one of said at least the first and at least the second configuration by means of an if/then mechanism, in which the then function implements at least one function selected from the group of:

adding said identification code to the user identifiers to be organized in said first configuration, and

associating with the user identifiers to be organized at least one of the country prefix and the local prefix in said second configuration.

58. (Previously Presented) The terminal as claimed in claim 54, wherein the terminal can receive from the user of the terminal information relating to a location of said terminal and said processing capacity is configured for switching said user identifiers between said first configuration and said second configuration following the receipt of the information.

59. (Previously Presented) The terminal as claimed in claim 54, wherein the terminal can detect a location of said terminal and said processing capacity is configured for switching said user identifiers between said first configuration and said second configuration according to the detected location of the terminal.

60. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally consisting of 7 or 8 digits

by adding a digit 0, the local prefix identified by the user and said identification code to the user identifiers organized in said first configuration,

by adding a character "+", the country prefix and the local prefix provided by the user to the user identifiers organized in said second configuration.

61. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally consisting of 10 or 11 digits

by adding said identification code to the user identifiers organized in said first configuration, and

by removing a "0" in a first position and adding the country prefix to the user identifiers organized in said second configuration.

62. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally consisting of 12 or 13 digits

by replacing a second and a third digit with said identification code in the user identifiers organized in said first configuration, and

by removing a "0" in a first position and the second and third digits, and replacing the second and third digits with an international prefix in the user identifiers organized in said second configuration.

63. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally comprising the code "00"

by replacing a third and a fourth digit with said identification code in the user identifiers organized in said first configuration, and

by removing the first four digits and adding a symbol "+" to the user identifiers organized in said second configuration.

64. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally comprising said country prefix

by removing said country prefix and including said identification code in the user identifiers organized in said first configuration, and

by leaving the user identifiers unchanged in the case of said second configuration.

65. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for organizing said user identifiers originally comprising a symbol "+"

by removing the symbol “+” and entering said identification code preceded by two “0” symbols in the user identifiers organized in said first configuration, and

by leaving the user identifiers unchanged in the case of said second configuration.

66. (Previously Presented) The terminal as claimed in claim 54, wherein said processing capacity is configured for leaving the user identifiers unchanged, without carrying out the configuration in said at least the first and at least the second configuration, when user identifiers corresponding to special services are present.

67. (Previously Presented) The terminal as claimed in claim 54, wherein said plurality of configurations comprises a network call configuration with an associated identification code consisting of a code for activation of a call by the network, designed to enable said terminal to be called back by the corresponding network.

68. (Previously Presented) The terminal as claimed in claim 67, wherein said call activation code is associated with a prepaid roaming service.

69. (Previously Presented) The terminal as claimed in claim 54, wherein said plurality of configurations comprises a debiting configuration with an associated identification code consisting of a billing code for configuring stored numbers of said terminal for making calls to be debited to a called user.

70. (Previously Presented) The terminal as claimed in claim 54, wherein said plurality of configurations comprises an authorization configuration with an associated identification code consisting of a code which authorizes calls from two or more lines associated with the terminal or with a corresponding SIM-type card.

71. (Previously Presented) A card of the SIM type for a telecommunications network terminal, wherein said card hosts, at least partially, at least one of said storage area and said processing capacity for a terminal according to any one of claims 54, 55, 57, 59-70.

72. (Currently Amended) A non-transitory computer readable medium encoded with a computer program product loadable into the memory of at least one computer and containing portions of software code for implementing the method according to any one of claims 37, 38, 40, 42-53, and 73.

73. (Previously Presented) A method for processing user identifiers stored in a terminal for telecommunications networks, comprising:

modifying the user identifiers by including an identification code of an operator selected by a user of the terminal or at least one of a country prefix and a local prefix;

selectively organizing said user identifiers in one of a plurality of configurations, said plurality of configurations comprising at least a first and a second configuration; and

receiving from the user of the terminal information relating to a location of said terminal and the operation of switching said user identifiers between said first configuration and said second configuration following the receipt of the information,

wherein said first configuration comprises the user identifiers organized with the insertion of the identification code of the operator selected by the user of the terminal,

wherein said second configuration comprises the user identifiers organized with the inclusion of at least one of the country prefix and the local prefix, and

wherein the modified user identifiers are stored in the terminal.

74. (Previously Presented) A terminal for telecommunications networks, comprising at least a storage area for storing user identifiers and acting as an electronic address book, and processing capacity for processing the user identifiers stored in said storage area, said processing capacity being configured for modifying the user identifiers by including an identification code of an operator selected by a user of the terminal or at least one of a country prefix and a local

prefix and organizing said user identifiers selectively in one of a plurality of configurations, said plurality of configurations comprising at least a first and a second configuration,

wherein said first configuration comprises the user identifiers organized with the insertion of the identification code of the operator selected by the user of the terminal,

wherein said second configuration comprises the user identifiers organized with the inclusion of at least one of the country prefix and the local prefix,

wherein the modified user identifiers are stored in the terminal, and

wherein the terminal can receive from the user of the terminal information relating to a location of said terminal and said processing capacity is configured for switching said user identifiers between said first configuration and said second configuration following the receipt of the information.
